<ul style="list-style-type: none">• Informational (~80%)• Navigational (~10%)• Transactional (~10%)	<ul style="list-style-type: none">• Expressed in natural language• Info we seek may not be in our language• Language is ambiguous• No. of documents rapidly increasing
<ul style="list-style-type: none">• Terms related to movies, songs, recipes etc.• Queries with ‘obtaining’ terms.• Download terms.• Entertainment terms.• Interaction terms (‘buy’, ‘chat’).	<ul style="list-style-type: none">• Company/business/organisation name.• Domain suffix (.com, .co.uk).• Contains ‘web’.• Query is less than 3 words.
A means of representing documents and of representing queries.	Use of question words. Many phrases. Informational items e.g. ‘list of’. Query length larger than 2 words.
Take vectors for each term and perform a bitwise AND.	A mathematic matrix that describes the frequency of terms that occur in a collection of documents.

DOCS AND DATA

Given the following document-term matrix, answer the query 'Brutus AND Caesar'

	<i>Antony & Cleopatra</i>	<i>Julius Caesar</i>	<i>The Tempest</i>
<i>Antony</i>	<i>1</i>	<i>0</i>	<i>0</i>
<i>Brutus</i>	<i>1</i>	<i>1</i>	<i>0</i>
<i>Caesar</i>	<i>1</i>	<i>1</i>	<i>1</i>

What is the concept of an inverted index?

DOCS AND DATA

What is the name of a term in an inverted index?

DOCS AND DATA

What are the four major steps in building an index?

DOCS AND DATA

In what form is the input to an inverted indexer?

<p>A model for information retrieval in which we can pose any query which is in the form of a boolean expression of terms.</p>	<p>$110 \ \& \ 111 = 110$</p> <p>Antony & Cleopatra, Julius Caesar</p>
<p>Only store the 1s which leads to using an inverted index.</p>	<p>If we have a realistic collection of documents ($N = 1M$) in which each document hold 1,000 terms. If we assume 500,000 unique words in the whole collection, our matrix will have half a trillion 1s and 0s.</p>
<p>A posting</p>	<ol style="list-style-type: none">1. Keep a dictionary of terms.2. For each term, have a list that records which documents it occurs in.
<p>A sequence of (modified token, document ID) pairs.</p>	<ol style="list-style-type: none">1. Collect documents to be indexed.2. Tokenize text, turning each document into a list of tokens (tokenizer).3. Do linguistic preprocessing, producing normalized tokens, which are the indexing terms (linguistic modules).4. Index the documents that each term occurs in by creating an inverted index (indexer)

<p>DOCS AND DATA</p> <p><i>What happens straight after an inverted indexer receives its input?</i></p>	<p>DOCS AND DATA</p> <p><i>What happens straight after an inverted indexer's input is sorted?</i></p>														
<p>DOCS AND DATA</p> <p><i>How is a boolean AND query processed by using an inverted index?</i></p>	<p>DOCS AND DATA</p> <p><i>How can AND queries be optimized when using an inverted index?</i></p> <p><i>For example: Brutus AND Caesar AND Caplurnia</i></p>														
<p>DOCS AND DATA</p> <p><i>How can OR/AND queries be optimized when using an inverted index?</i></p>	<p>DOCS AND DATA</p> <p><i>Given the following, what's the processing order?</i></p> <table><tr><th><i>Term</i></th><th><i>Frequency</i></th></tr><tr><td><i>eyes</i></td><td><i>213,312</i></td></tr><tr><td><i>cat</i></td><td><i>87,009</i></td></tr><tr><td><i>dog</i></td><td><i>107,913</i></td></tr><tr><td><i>skies</i></td><td><i>271,658</i></td></tr><tr><td><i>owl</i></td><td><i>46,653</i></td></tr><tr><td><i>trees</i></td><td><i>316,812</i></td></tr></table> <p><i>(cat OR trees) & (dog OR skies) & (owl OR eyes)</i></p>	<i>Term</i>	<i>Frequency</i>	<i>eyes</i>	<i>213,312</i>	<i>cat</i>	<i>87,009</i>	<i>dog</i>	<i>107,913</i>	<i>skies</i>	<i>271,658</i>	<i>owl</i>	<i>46,653</i>	<i>trees</i>	<i>316,812</i>
<i>Term</i>	<i>Frequency</i>														
<i>eyes</i>	<i>213,312</i>														
<i>cat</i>	<i>87,009</i>														
<i>dog</i>	<i>107,913</i>														
<i>skies</i>	<i>271,658</i>														
<i>owl</i>	<i>46,653</i>														
<i>trees</i>	<i>316,812</i>														
<p>DOCS AND DATA</p> <p><i>What are some Boolean model pros?</i></p>	<p>DOCS AND DATA</p> <p><i>What are some Boolean model cons?</i></p>														

<p>Multiple term entries in a single document are merged and then data is split into dictionary and postings list.</p>	<p>The input is sorted by modified token and then by document ID.</p>
<p>Process the query in order of increasing frequency i.e. process the query with the smallest summed postings list size first.</p>	<ol style="list-style-type: none"> 1. Locate the terms in the index. 2. Intersect their postings lists.
<ol style="list-style-type: none"> 1. (dog OR skies) AND (owl OR eyes) 2. (1) AND (cat OR trees) 	<p>Estimate the size of each OR query by summing the document frequencies of each term, then process by lowest frequency first.</p>
<ul style="list-style-type: none"> • AND gives too few or no results, OR gives too many. • No ordering of results. • Order of words in document not used. • Basic boolean expressions too limiting for informational needs. • Non-expert user doesn't understand boolean operators. 	<ul style="list-style-type: none"> • Simple model, easy/efficient to implement. • Precise. Document either matches or doesn't. • Widely used for commercial, legal retrieval and for specialist searches.

<p>DOCS AND DATA</p> <p><i>What are the three main classes of tokens involved in tokenization?</i></p>	<p>DOCS AND DATA</p> <p><i>What is a major issue with splitting documents on spaces?</i></p>
